

Setting Up a New Account — Vnotice

There's no separate sign-up screen — account creation happens inline, in one panel, the first time someone links their alerts.

1. Open Settings → Alert Channels

Find the panel titled “**Link to Vnotice Alerts (server-side)**” near the top.

2. Enter email and choose a password

Fill in the new user's **Email** and an **Account Password** in that panel. The password field's placeholder says it plainly: “First time = creates the account.”

3. Click “Link Account”

One button does both jobs: it first tries to log in with that email/password. If no account exists yet, it automatically registers one, then logs in — there is no separate sign-up form to fill out.

4. Pick feed sources

Once linked, the panel switches to a list of feed sources (Check Point, Fortinet, NVD, etc.). Check the ones this user wants alerted on.

5. Click “Save Alert Settings to Server”

This saves the selected feeds as real trigger rules on the server, so the hourly auto-sync job can alert this user even while their browser is closed.

6. Fill in delivery details

In the adjacent Email Alerts / Teams panels on the same Settings page, add SMTP or webhook details — the triggers saved in step 5 need somewhere to actually send to.

Getting a Teams webhook URL (needed for step 6, Teams alerts only)

The Teams field's placeholder (`https://...logic.azure.com/workflows/...`) expects a modern Power Automate **Workflow** URL, not an old-style connector. Whoever owns the target Teams channel sets this up, in Teams itself (web or desktop app):

- 1 Open the channel that should receive alerts.
- 2 Click “...” next to the channel name → **Workflows** (search for the “Workflows” app if it isn't pinned).
- 3 Pick the template “**Post to a channel when a webhook request is received.**”
- 4 Confirm the team/channel, then click **Add workflow**.
- 5 Teams generates a webhook URL — copy it.

- 6 Paste that URL into Vnotice's Teams webhook field and click **Send Test** to confirm it before saving.

Vnotice also still accepts the legacy `*.webhook.office.com/webhookb2/. . .` classic connector URL, for tenants that still have it enabled — but Microsoft has been retiring that path tenant-by-tenant, so the Workflow steps above are the ones that'll reliably work for a new setup. Email alerts (SMTP) need no equivalent web-side setup.

No admin action is required — registration is fully self-service (there is no invite code or admin approval step), and a default alert configuration is created automatically for the new account.

Rate limit: login and registration are both capped at 5 attempts per 60 seconds per IP address. A mistyped password a few times in a row will trigger a “too many attempts” message for about a minute before it can be retried.
